

# Multiple Joy stick Code

Robot. Java

- Look at AutoSelectInit()
- Make similar for Joystick

For example in Robot.java

```
Joystick SelectInit()
```

```
{
```

```
    chooser = new SendableChooser();
```

```
    chooser.addDefault("Tank Drive, 0");
```

```
    chooser.addObject("GTA Drive, 1");
```

```
    chooser.addObject("Another Drive, 2");
```

```
}
```

In Utils. ConsolePrinter

```
SmartDashboard.putData("Joystick chooser" ...)
```

In Drive with Joystick Command

execute

```
switch (Robot.chooser.getSelected());
```

```
    case 0:
```

```
        TankDrive();
```

```
    case 1:
```

```
        GTA();
```

Where Tank Drive, GTA are methods inside Drive with Joysticks
